

# Letting the Earth breathe so you can sleep at night

A Florida landfill's gas to energy plant generates enough "green" energy to supply 4,000 homes on the local electric power grid. Soon after startup, the plant was only operating at 33% capacity.

The problem? Gas extraction wells were "watered in" with high levels of hot, corrosive liquids, choking off methane recovery efficiency. The solution? Automatic, air-powered AutoPumps® from QED. Their durable, reliable performance pumped the wells down and rapidly restored the system to full power, maintaining it there ever since. And being air-powered helped keep the site safe.

*All QED pumps are supported by the world's #1 network of application specialists and trained local representatives, plus the best warranty protection in the industry. Give us a call.*
